Lowara

Threaded horizontal multistage centrifugal electric pumps

2HM-4HM 2HMS-4HMS Series

MARKET SECTORS

INDUSTRIAL, CIVIL, AGRICULTURAL.

APPLICATIONS

- Pumping of water for domestic (HM) and industrial use (HMS).
- Small irrigation systems. The HMS series pump can handle water (containing additives) having moderate chemical aggressiveness, but free of suspended solids.
- Composition of pressure booster units for various purposes.
- Pumping of liquids compatible with AISI 316L stainless steel (DIN 1.4404) for HMS version.

SPECIFICATIONS

- **Delivery:**
2HM-4HM: up to 120 l/min (7.2 m³/h).
2HMS-4HMS: up to 120 l/min (7.2 m³/h).
- **Head:**
2HM-4HM: up to 60.7 meters.
2HMS-4HMS: up to 51.2 meters.
- Maximum operating pressure: 8 bar (PN8).
- Continuous duty.
- **Temperature** of pumped liquid:
-10°C to +60°C for HM.
-10°C to +110°C for HMS.
- Enclosed motor with external ventilation and finned casing made of aluminum alloy.
- Single-phase version with 220-240 V 50 Hz power supply, permanent capacitor and built-in, automatic reset overload protection. Three-phase version with 220-240/380-415 V 50 Hz power supply, overload protection to be provided by user.
- **Power:**
2HM-4HM: up to 0.9 kW.
2HMS-4HMS: up to 0.75 kW.
- Class F insulation.
- IP55 protection.

LIQUID END MADE ENTIRELY OF STAINLESS STEEL FOR HMS

SILENT OPERATION

HIGH PERFORMANCE AND RELIABILITY

MATERIALS

HM - HMS MECHANICAL SEAL

The standard configuration has the characteristics shown in fig. 1 and table 1.

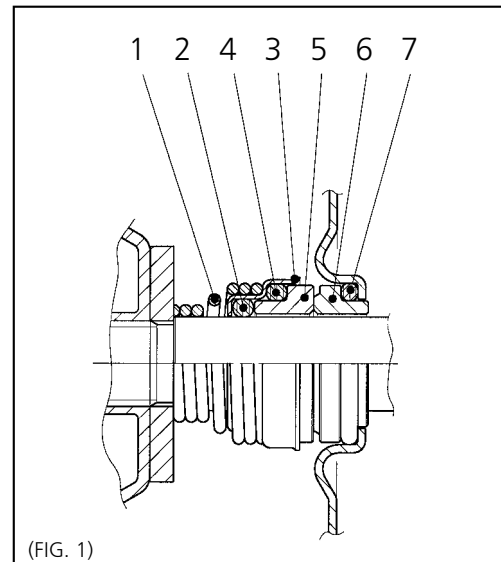

STANDARD MATERIALS (TABLE 1)

POS.	COMPONENT	MATERIAL
1	Spring	AISI 316 stainless steel
2	Shaft gasket	EPDM
3	Armature	AISI 316 stainless steel
4	Rotating assembly gasket	EPDM
5	Rotating assembly seal ring	Ceramic
6	Fixed assembly ring	Carbon
7	Fixed assembly gasket	EPDM

Various alternative materials are available on request.

The special configuration has the characteristics shown in fig. 1 and table 2.

A fixed-seal design with an anti-rotation lockpin is available on request.

ALTERNATIVE MATERIALS (TABLE 2) (on request)

To determine the code of the electric pump with mechanical seal and O-rings made of alternative materials, the extension shown in the table must be added to the standard code.

EXTENSION CODE	POS. 1-2-3-4-7	MATERIAL 5 - 6
XAA	FPM	Ceramic - Special carbon
		Silicon carbide - Special carbon
		Silicon carbide - Tungsten carbide
		Tungsten carbide - Tungsten carbide*
XAA	FPM	Ceramic - Carbon
		Ceramic - Special carbon
		Silicon carbide - Special carbon
		Silicon carbide - Silicon carbide
		Silicon carbide - Tungsten carbide
		Tungsten carbide - Tungsten carbide*

* A version with anti-rotation lockpin is available on request.

ELECTRIC PUMP IDENTIFICATION CODE

The HM-HMS series models are identified as follows:

**2HM SERIES
OPERATING CHARACTERISTICS AT 2850 rpm 50 Hz**

The performances are valid for liquids with density $\rho = 1.0 \text{ kg/dm}^3$ and kinematic viscosity $\nu = 1 \text{ mm}^2/\text{sec}$.

**4HM SERIES
OPERATING CHARACTERISTICS AT 2850 rpm 50 Hz**

044888_B_CH

The performances are valid for liquids with density $\leq 1.0 \text{ kg/dm}^3$ and kinematic viscosity $\leq 1 \text{ mm}^2/\text{sec}$.

**2HMS SERIES
OPERATING CHARACTERISTICS AT 2850 rpm 50 Hz**

04489A_B_CH

The performances are valid for liquids with density $\rho = 1.0 \text{ kg/dm}^3$ and kinematic viscosity $\nu = 1 \text{ mm}^2/\text{sec}$.

**4HMS SERIES
OPERATING CHARACTERISTICS AT 2850 rpm 50 Hz**

The performances are valid for liquids with density $\leq 1.0 \text{ kg/dm}^3$ and kinematic viscosity $\leq 1 \text{ mm}^2/\text{sec}$.

(X) - Positive suction head required

 1 = Good compatibility
 2 = Poor compatibility
 3 = No compatibility

(1) Dangerous liquid (toxic, poisonous, attacks skin, irritant, etc.).

(2) Flammable and explosive liquid.

(3) 4-poles versions only.

(4) The stainless steel compatibility depends on the chlorine content in relationship with the liquid temperature, a detailed analysis is necessary.

TYPICAL APPLICATIONS OF HM SERIES ELECTRIC PUMPS***Water Purification:***

Filtration
De-ionized water
Water treatment
Commercial and residential pools

Waste Management:

Waste treatment
Pollution control

Plastics

Temperature control
Extrusion machines
Manufacture of polymers
Heat treatment

Machine Tool

Degreasing
Parts washing
Chemical treatment

Agricultural/ residential applications: Graphics:

Irrigation
Greenhouses
Humidifiers
Water supply
Film washing
Cooling processes

Heating, Ventilating & Air Conditioning (HVAC)

Air scrubbers
Water re-circulation
Cooling towers
Cooling systems
Temperature control
Chillers
Induction heating
Heat exchangers
Water heating

Marine:

Water on board ships

Computers:

Washing of circuit boards
Unit cooling

Laundry:

Commercial washing

Food and Drink:

Food processing
Bottle washing
Citrus Processing
Dish washing
Brewing
Sanitary ware

General Industry:

Spray Booths
Light chemical transfer
Boster systems

Medical:

Laser cooling
Massages
Medical chillers
Sanitary equipment

NPSH

The minimum operating values that can be reached at the pump suction end are limited by the onset of cavitation.

Cavitation is the formation of vapour-filled cavities within liquids where the pressure is locally reduced to a critical value, or where the local pressure is equal to, or just below the vapour pressure of the liquid.

The vapour-filled cavities flow with the current and when they reach a higher pressure area the vapour contained in the cavities condenses. The cavities collide, generating pressure waves that are transmitted to the walls. These, being subjected to stress cycles, gradually become deformed and yield due to fatigue. This phenomenon, characterized by a metallic noise produced by the hammering on the pipe walls, is called incipient cavitation.

The damage caused by cavitation may be magnified by electrochemical corrosion and a local rise in temperature due to the plastic deformation of the walls. The materials that offer the highest resistance to heat and corrosion are alloy steels, especially austenitic steel. The conditions that trigger cavitation may be assessed by calculating the total net suction head, referred to in technical literature with the acronym NPSH (Net Positive Suction Head).

The NPSH represents the total energy (expressed in m.) of the liquid measured at suction under conditions of incipient cavitation, excluding the vapour pressure (expressed in m.) that the liquid has at the pump inlet.

To find the static height h_z at which to install the machine under safe conditions, the following formula must be verified:

$$h_p + h_z \geq (NPSH_r + 0.5) + h_f + h_{pv} \quad \text{①}$$

where:

- h_p** is the absolute pressure applied to the free liquid surface in the suction tank, expressed in m. of liquid; h_p is the quotient between the barometric pressure and the specific weight of the liquid.
- h_z** is the suction lift between the pump axis and the free liquid surface in the suction tank, expressed in m.; h_z is negative when the liquid level is lower than the pump axis.
- h_f** is the flow resistance in the suction line and its accessories, such as: fittings, foot valve, gate valve, elbows, etc.
- h_{pv}** is the vapour pressure of the liquid at the operating temperature, expressed in m. of liquid. h_{pv} is the quotient between the P_v vapour pressure and the liquid's specific weight.
- 0.5** is the safety factor.

The maximum possible suction head for installation depends on the value of the atmospheric pressure (i.e. the elevation above sea level at which the pump is installed) and the temperature of the liquid.

To help the user, with reference to water temperature (4°C) and to the elevation above sea level, the following tables show the drop in hydraulic pressure head in relation to the elevation above sea level, and the suction loss in relation to temperature.

Water temperature (°C)	20	40	60	80	90	110	120
Suction loss (m)	0,2	0,7	2,0	5,0	7,4	15,4	21,5

Elevation above sea level (m)	500	1000	1500	2000	2500	3000
Suction loss (m)	0,55	1,1	1,65	2,2	2,75	3,3

Flow resistance is shown in the tables at pages 19-20 of this catalogue. To reduce it to a minimum, especially in cases of high suction head (over 4-5 m.) or within the operating limits with high flow rates, we recommend using a suction line having a larger diameter than that of the pump's suction port. It is always a good idea to position the pump as close as possible to the liquid to be pumped.

Make the following calculation:

Liquid: water at 15°C $\rho = 1 \text{ kg/dm}^3$
 Flow rate required: 30 m³/h
 Head for required delivery: 43 m.
 Suction lift: 3.5 m.
 The selection is an FHE 40-200/75 pump whose NPSH required value is, at 30 m³/h, 2.5 m.

For water at 15°C the h_{pv} term is $\frac{P_v}{\rho \cdot g} = 0,174 \text{ m (0.01701 bar)}$

and $h = \frac{P_a}{\rho \cdot g} = 10,33 \text{ m}$

The H_f flow resistance in the suction line with foot valves is 1.2 m.

By substituting the parameters in formula ① with the numeric values above, we have:

$$10,33 + (-3,5) \geq (2,5 + 0,5) + 1,2 + 0,17$$

from which we have: 6.8 > 4.4

The relation is therefore verified.

THE FLOW RESISTANCE MUST BE MULTIPLIED BY:

- 0.8 for stainless steel pipes
- 1.25 for slightly rusted steel pipes
- 1.7 for pipes with deposits that reduce the flow section
- 0.7 for aluminium pipes
- 1.3 for fibre-cement pipes

Hr = FLOW RESISTANCE (m/100 m OF PIPELINE)

V = WATER SPEED (m/sec)

- 1) Flow resistance in bends is due to the contraction of the liquid threads resulting from the change of direction: the development of the bends must therefore be included in the length of the pipeline.
- 2) Flow resistance in valves and gates was determined on the basis of practical tests.
